

# Mobilize Your Data Collection Processes

Mi-Forms mobile forms software is the flexible, secure and user-friendly solution for mobilizing a wide variety of data collection processes. Mi-Forms is the proven solution for transforming QA/QC inspection, maintenance, safety, and shipping/receiving processes amongst others.

## Mi-Forms Features

**Any Device:** Mi-Forms works with any relevant device of your choice, including iPads, iPhones, Android tablets, Microsoft devices, PCs, Anoto Digital Pens with paper, virtual and on-premise servers, laptops and workstations.

**Offline/Online:** Mi-Forms works offline in remote field situations where a network connection is not available. Mi-Forms is equipped with a robust Data Replication feature, which allows for offline access to important data and information. Once the device regains connectivity, the data collected syncs up automatically.

**Photo Capture & Inking:** Add photos directly into the form with the ability to add annotations and notes. Mi-Forms can even prompt the user for photo capture with workflow rules.

**Handwriting Interpretation:** Write with your digital pen or your fingertip and Mi-Forms will quickly and accurately interpret your handwriting. This is an easy way to collect signatures and field notes.

**Speech Recognition & Capture:** Easily collect data hands-free by speaking naturally into your device's native speech capture tool or by integrating with the SayIt™ voice recognition and capture solution.

**Barcode Scanning, GPS Tracking & RFID:** Quickly and easily capture barcodes and store them directly within the form. Mi-Forms also comes equipped with GPS and RFID tracking capabilities that can be used to add a layer of trackability, lookup directions, and much more.

**Compliance Driven:** Mi-Forms software and Mi-Corporation follow good software development practices for FDA 21 CFR Part 11 compliance and have passed thorough audits by large global companies.

**Workflow & Audit Trails:** The Mi-Forms server is an enterprise-class administrative server that works as a central management system for users, forms and data flows, version control, audit trails and routing workflows.

**Intelligent Feedback:** The Mi-Forms Designer can specify real-time feedback during data collection. The feedback may occur when data is entered, calculations are performed, or when business rules are violated.

**Flexible Integrations:** Send data directly to your MES applications, databases, document management systems and more--using web services, flat file exchange, APIs, SDKs and more.
