

NO CONNECTION? *NO PROBLEM.*

In a world that constantly works on-the-go, it's important to have software that can work with you--even when you're traveling through a tunnel or find yourself in no-man's-land.

Software that securely stores data offline.

Data is stored within the software containers, encrypted, on the device, when no connectivity is available. Data is synced when reconnected, and residual data is deleted from the device upon successful upload.

Pre-populate information with local data.

We store fresh data locally on your mobile device via a SQL Lite database, so fields can be automatically populated with reference data and other historical information.

Have offline data access issues?
